12 2 Accumulating investment, technology and production capabilities for advanced digital production
23 3 Areas of policy action to make ADP technologies work for ISID
29 A1 Countries and economies by level of engagement with ADP technologies applied to manufacturing
The emergence and diffusion of advanced digital production (ADP) technologies of the fourth industrial revolution are radically altering manufacturing production, increasingly blurring the boundaries between physical and digital production systems. Advances in robotics, artificial intelligence, additive manufacturing and data analytics generate significant opportunities to accelerate innovation and increase the value-added content of production in manufacturing industries.

This 2020 Industrial Development Report contributes to the debate on the fourth industrial revolution by presenting fresh analytical and empirical evidence on the future of industrialization in the context of the present technological paradigm shift.

One frequent claim is that robots will replace factory workers, such that industrialization will not create the same number of job opportunities as in the past. Another is that advanced countries will backshore previously outsourced production. A third is that the minimum threshold of skills and capabilities to remain competitive in manufacturing will be so high that it will exclude most countries from the next phase of manufacturing production. This report empirically examines the validity of these challenges.

A key finding of this publication is that industrialization continues to be the main avenue for successful development. Industrialization enables countries to build and strengthen the skills and capabilities to compete and succeed within the new technological paradigm. The analysis shows that ADP technologies applied to manufacturing production offer huge potential to advance economic growth and human well-being and to safeguard the environment, contributing to the 2030 Agenda for Sustainable Development.

This concerns, in particular, Sustainable Development Goal 9—Build resilient infrastructure, promote inclusive and sustainable industrialization and foster innovation—which is central to UNIDO’s mandate. These technologies can increase the efficiency and productivity of industrial production processes, and there is evidence that it can also help create new industries.

This publication also shows that, although a large number of jobs will be vulnerable to automation as new technologies diffuse across countries and industries, it is also likely to create new industries and new job opportunities in more skilled and knowledge-based sectors. The evidence in this report suggest that, once indirect effects along the value chain are considered, the increase in the stock of robots used in manufacturing at the global level is actually creating employment, not destroying it. Evidence on backshoring from emerging to industrialized economies due to the adoption of new technologies indicates that this phenomenon is not widespread. Findings show that back-shoring is counterbalanced by offshore production in developing countries, which creates opportunities for jobs, backward and forward value chain linkages.

The impact of ADP technologies on developing countries will ultimately depend on their policy responses. There is no “one-size-fits-all” policy strategy to make the new technologies work for inclusive and sustainable industrial development. Our 2020 report provides some strategic policy directions as the fourth industrial revolution deepens in the coming years. Three areas deserve particular attention: (i) developing framework conditions, in particular digital infrastructure, to embrace the new technologies; (ii) fostering demand and leveraging on ongoing initiatives using ADP technologies; and (iii) strengthening required skills and research capabilities. The report provides several examples of specific policies currently implemented in different countries to address each of these dimensions.

Foreword
A striking finding emerging from the report is the large number of countries that have yet to enter into the era of ongoing technological breakthroughs. Large parts of the world, mostly in least developed countries and other low-income countries, are still far from utilizing ADP technologies on a significant level. Firm-level data collected for this report in five developing countries reinforce this understanding by showing that the manufacturing sector in these countries is characterized by "technology islands", where few (if any) digital leaders coexist with a large majority of firms using outdated technologies. Up to 70 percent of the manufacturing sector in "lagging economies" are still using analog technologies in its manufacturing production.

The lack of diffusion of potentially useful technologies strengthens the call for the further enhancement of the global partnership for sustainable development. Efforts to mobilize and share knowledge, expertise, technology and financial resources to secure the aim of 2030 Agenda for Sustainable Development to leave no one behind must be increased. Low-income countries require appropriate digital infrastructure and skills to take advantage of the fourth industrial revolution and to avoid the risk of lagging further behind. This report shows that there are merits for low-income countries to engage in manufacturing production, to strengthen industrial capabilities and learn how these technologies can be used productively. Sustained, inclusive and sustainable economic growth is essential for prosperity.

I am pleased that this report brings an original dimension to the analysis of new technologies and the fourth industrial revolution, and reaffirms the role of industrialization as a driver of development. Industrial development that is inclusive and sustainable will help build dynamic, sustainable, innovative and people-centred economies—this we must strive for, as the international community progresses towards the achievement of the 2030 Agenda for Sustainable Development.

I thank the UNIDO staff members and international experts who worked on this report, and I look forward to it serving as a reference document in the international development debate on the fourth industrial revolution.

LI Yong
Director General, UNIDO
The Industrial Development Report (IDR) 2020 was prepared under the overall guidance of Li Yong, Director-General of the United Nations Industrial Development Organization (UNIDO). It is the result of two years of intense research efforts, fruitful discussions and close collaboration of an in-house team headed by Cecilia Ugaz, Director for the Department of Policy, Research and Statistics. The team was coordinated by Alejandro Lavopa, who played an instrumental role in the successful completion of the report, and comprised Elisa Calza, Nicola Cantore, Nelson Correa, Smeeta Fokeer, Nobuya Haraguchi, Fernando Santiago Rodríguez and Adnan Seric.

A string of commissioned background papers greatly benefited the drafting of the report, and were submitted by the following experts: Ramiro Albrieu, Caterina Brest López, and Martín Rapetti, Center for the Implementation of Public Policies Promoting Equity and Growth (CIPPEC); Antonio Andreoni, the School of Oriental and African Studies (SOAS) at the University of London; Guendalina Anzolin, University of Urbino; Francesco Bogliacino, National University of Colombia; Cristiano Codagnone, University of Milan and Open University of Catalonia; Bernhard Dachs, Austrian Institute of Technology; Michele Delera, Neil Foster-McGregor, Carlo Pietrobelli, Önder Nomaler, and Bart Verspagen, United Nations University-Maastricht Economic and Social Research Institute on Innovation and Technology (UNU-MERIT); João Carlos Ferraz, David Kupfer, Jorge Nogueira de Paiva Britto and Julia Torracca, Institute of Economics of the Federal University of Rio de Janeiro (IE-UFRJ); Mahdi Ghodsi, Oliver Reiter, Robert Stehrer, and Roman Stöllinger, The Vienna Institute for International Economic Studies (WIIW); Chiharu Ito, Michiko Iizuka, and Izumi Suzuki, National Graduate Institute for Policy Studies (GRIPS); Bart Kemp and Raquel Vázquez, Basque Institute of Competitiveness (Orkestra); Erika Kraemer-Mbula, University of Johannesburg; Keun Lee, Seoul National University; Amaia Martinez and Cristina Oyón, Basque Business Development Agency (SPRI); Mario Pianta, Roma Tre University; and Alina Sorgner, John Cabot University.

To support the analysis of the report, carefully considered firm-level surveys were designed and implemented in three countries: Ghana, Thailand and Viet Nam. The team is grateful to the following partner institutions for their meticulous work in collecting the corresponding data: the Council for Scientific and Industrial Research (CSIR)-Science and Technology Policy Research Institute (STEPRI) in Ghana, the Digital Economy Promotion Agency (DEPA) in Thailand, and the National Center for Socio-Economic Information and Forecast (NCIF) in Viet Nam. These surveys were developed following the approach put forward in Brazil by the Brazilian National Confederation of Industry (CNI) and replicated in Argentina by the Argentine Industrial Union (UIA) in cooperation with CIPPEC and the Institute for the Integration of Latin America and the Caribbean of the Inter-American Development Bank (INTAL-IDB). We are grateful to these institutions for facilitating access to the microdata of corresponding surveys from these two countries.

To complement the survey results, the team also collected case studies on manufacturing firms from other developing countries. Profound appreciation is directed to Ciyong Zou and the UNIDO staff from the field offices who have made the data collection process possible, namely: Manuel Albaladejo, Nadia Afhtub, Ralf Bredeel, Soosiriri Chamsuk, Stein Hansen, Hanan Hanzaz, Muhammad Hammad Bashir Saeed, Lina Touri, René van Berkel, Rajeev Vijh, and Süleyman Yilmaz. The work was supported by Valeria Cantera, Nurshat Karabashov, Sebastián Pérez, Nidhi Sharma, Hongfei Yue and Azhar Zia-ur-Rehman. We are also thankful to the following institutions which facilitated the collection of data in some of these
countries: the Ministry of Industry and Information Technology from China, the Ministry of International Trade and Industry from Malaysia, the Turkish Industry and Business Association (TUSIAD) and the Chamber of Industries of Uruguay (CIU).

The report greatly benefited from constructive comments by members of UNIDO’s Executive Board, namely Fatou Haidara, Hiroshi Kuniyoshi and Philippe Scholtes. Our special thanks also go to John Weiss, Emeritus Professor at the University of Bradford, Jörg Mayer, Senior Economic Affairs Officer at the United Nations Conference on Trade and Development (UNCTAD), and Alistair Nolan, Senior Policy Analyst at the Organisation for Economic Co-operation and Development (OECD), for thoroughly reviewing the draft of the report and significantly improving several of its sections.

Many of the concepts introduced and elaborated in the report were presented and discussed at two workshops with international experts at UNIDO headquarters in Vienna in November 2018 and April 2019 and at internal presentations with UNIDO staff during May 2019. During these meetings insightful comments were provided by Sara Amoroso, European Commission–Joint Research Centre; and Mike Gregory, University of Cambridge; as well as UNIDO staff members Arno Behrens, Kai Bethke, Bernardo Calzadilla, Tsung Ping Chung, Michele Clara, Jacek Cukrowski, Tareq Emtairah, Ayumi Fujino, Dong Guo, Anders Isaksson, Jaehwan Jung, Bettina Schreck, Nilgun Tas, Valentin Todorov, and Shyam Upadhyaya. Additionally, valuable comments to the draft were given by UNIDO staff Weixi Gong, Nan Ji, Olga Memedovic, and Alejandro Rivera.

The authors of the report were backed by a talented team of research assistants and interns at UNIDO including Jürgen Amann, Shengxi Cao, Charles Fang Chin Cheng, Alessandra Celani de Macedo, and Lorenzo Navarini. UNIDO staff members Angie Belsaguy, Nevena Nenadic, and Iguaraya Saavedra provided extensive administrative support, and Niki Rodousakis provided copy-editing assistance. In the final drafting phase, UNIDO consultant Ascha Lychet Pedersen was instrumental in preparing the report for print. The report was edited and designed by a team at Communications Development Incorporated, led by Bruce Ross-Larson and including Joseph Brinley, Joe Caponio, Meta de Coquereaumont, Mike Crumplar, Debra Naylor (Naylor Design), Christopher Trott and Elaine Wilson.

Overview

Industrializing in the digital age

Advanced digital production technologies can foster inclusive and sustainable industrial development and the achievements of the SDGs

The emergence and diffusion of advanced digital production (ADP) technologies—artificial intelligence, big data analytics, cloud computing, Internet of Things (IoT), advanced robotics and additive manufacturing, among others—is radically altering the nature of manufacturing production, increasingly blurring the boundaries between physical and digital production systems. Under the right conditions, the adoption of these technologies by developing countries can foster inclusive and sustainable industrial development (ISID) and the achievement of the Sustainable Development Goals (SDGs).

Only a few economies and firms are creating and adopting ADP technologies

The creation and diffusion of ADP technologies, however, remains concentrated globally, with only weak development in most emerging economies. The Industrial Development Report (IDR) 2020 finds that 10 economies—the frontrunners—account for 90 percent of all global patents and 70 percent of all exports directly associated with these technologies. Another 40 economies—the followers—actively engage in these technologies, though with much more modest intensity. The rest of the world either shows very little activity (the latecomers) or fails to take part in the global creation and use of these technologies (the laggards).

But ADP technologies open new opportunities for catching up

ADP technologies do open new opportunities for catching up, but exploiting them requires a minimum base of industrial capabilities. A clear positive relationship exists between the roles of different economies as frontrunners, followers, latecomers and laggards in the creation and use of these technologies and their average industrial capabilities. Greater engagement with these technologies is associated with higher rates of growth in manufacturing value added (MVA), driven mainly by faster productivity gains. And contrary to common thinking, developing countries actively engaging with ADP technologies also present positive employment growth.

Why should we care about new technologies?

Technologies drive ISID through new products and new processes

New technologies and inclusive and sustainable industrial development

New technologies are at the core of successful ISID. They enable the creation of new goods, which leads to the emergence of new industries. And they support an increase in production efficiency, which brings prices down and opens consumption to the mass market—or increases profits, with possible follow-on effects for investment (Figure 1). In the right context, new technologies can also promote environmental sustainability and social inclusion.

New industries come from new technologies

New technologies can lead to product innovations, resulting in the emergence of new industries—and the jobs and incomes associated with them. This supports industrialization and social inclusion. When these innovations are geared to reducing environmental impacts—by introducing green manufacturing—they also promote the environmental sustainability of the industrial process.

Industrial competitiveness ultimately depends on technological upgrading

New technologies can also increase production efficiency, which is key to sustaining and fostering industrial competitiveness and, through this channel,
New technologies are at the core of successful ISID

expanding manufacturing production. In many cases, the very application of new technologies requires additional inputs and services from other sectors of the economy, thus increasing the multiplier effects of industrial development outside the boundaries of the factory. Greater efficiency is associated with reductions in pollutant emissions and material and energy consumption per unit of production, which can improve the environmental sustainability of the process.

**What are the new technologies shaping the industrial landscape?**

*First came the steam, electricity and computing-driven industrial revolutions*

Different waves of technological advancements have pushed economic development since the first industrial revolution (1IR). The invention of the steam engine, the mechanization of simple tasks and the construction of railroads triggered the 1IR between 1760 and 1840. The advent of electricity, the assembly line and mass production gave rise to the second industrial revolution (2IR) between the late 19th and early 20th century. The development of semiconductors and mainframe computing in the 1960s, together with personal computers and the internet, were the main engines of the third industrial revolution (3IR).

*Yet another wave is making its mark on the industrial landscape*

Recent technological breakthroughs seem to be pushing yet another wave, in what is commonly called the fourth industrial revolution (4IR). The concept is based on the growing convergence of different emerging technology domains—digital production technologies, nanotechnologies, biotechnologies and new materials—and their complementarity in production (Figure 2). Advanced manufacturing is the term typically used to denote the adoption of these technologies
ADP technologies give rise to smart manufacturing production systems

in manufacturing production. In the particular case of ADP technologies, their application to manufacturing gives rise to smart manufacturing production systems—also known as the smart factory or Industry 4.0. Smart production entails the integration and control of production from sensors and equipment connected in digital networks, as well as the fusion of the real world with the virtual—in so-called cyber-physical systems (CPSs)—with support from artificial intelligence. The shift to smart manufacturing production is expected to leave a long-lasting mark on the industrial landscape.

An evolutionary transition to ADP technologies

Technologies of the fourth industrial revolution arise from traditional industrial production

ADP technologies are the last in the evolution of traditional industrial production technologies (Figure 3). In fact, many of these technologies have evolved and emerged from the same engineering and organizational principles of previous revolutions, suggesting an “evolutionary transition” more than a “revolutionary disruption.” For instance, automating processes go back to the IIR, while the adoption of robots goes back at least to the 1960s (Andreoni and Anzolin 2019).

ADP hardware is a mix of old and new

ADP technologies result from the combination of three main components—hardware, software and connectivity (Figure 4). The hardware components are made of tools, tooling and the complementary equipment of modern industrial robots and intelligent automated systems, as well as cobots (robots co-operating with workers in the execution of tasks) and 3D printers for additive manufacturing. This set of hardware production technologies is largely similar to its
History’s technological revolutions have divided the world into leading and following economies,

predecessor in the 3IR. What makes these machines different is their connectivity and their flexibility and functionality in executing productive tasks.

**ADP connectivity is a big change from older manufacturing**

Connectivity in ADP technologies is achieved through the sensors in hardware, made possible by equipping machines and tools with actuators and sensors. Once machines and tools are able to sense the production process and products—their components, material and functional properties—they are also able to collect and transmit data through the industrial IoT. This type of connectivity opens the way for a paradigm shift from centralized to decentralized production.

**Connectivity leads to smart networked systems**

Production technologies become fully digital once their connectivity is enhanced by software, allowing big data analytics—that is, tools able to process vast quantities of data in near-real time. Building on computer-aided manufacturing (CAM), computer-integrated manufacturing (CIM) and computer-aided design (CAD) together with the improvements offered by information and communications technology (ICT) during the 3IR, the software of the 4IR has opened the way for cyber-physical systems. These are smart networked systems with embedded sensors, processors and actuators, designed to sense and interact with the physical world and support, in real time.

**Who is creating, and who is using ADP technologies?**

**A concentrated global landscape**

Industrial revolutions have leading and following economies,
Ten economies account for 91 percent of global patenting in ADP technologies

Depending on their involvement in creating and using the emerging technologies. In many cases, however, important parts of the world remained completely excluded from the ongoing revolution, entering only after several decades, when the technologies became cheap enough and the capability gap narrowed. A major concern at the onset of a new revolution is the extent to which all countries—especially those still trying to develop basic industrial capabilities—will be integrated into the emerging technological landscape.

The very top economies express the most ADP activity

Today’s technological breakthroughs in ADP are again dividing the world between leaders, followers and laggards. One striking feature of the creation and diffusion of ADP technologies is the extreme concentration, especially of patenting and exporting activity. In the distribution of both patenting and exporting, the average is extremely high relative to the median, and only a few economies are above it. So, the top economies (those above the average) explain most of the world activity in each area.

Ten frontrunner economies account for 90 percent of patents and 70 percent of exports

Only 10 economies show above-average market shares in the global patenting of ADP technologies. Ordered by their shares, these economies are the United States, Japan, Germany, China, Taiwan Province of China, France, Switzerland, the United Kingdom, the Republic of Korea and the Netherlands (Table 1). Together, they account for 91 percent of all global patent families. This group leads the rest of the world in creating new technologies within the ADP technology field. They not only invent the new technologies...
Only 50 economies can be considered as actively engaging with ADP technologies but also sell (and purchase) in global markets the goods embodying these technologies—they account for almost 70 percent of global exports and 46 percent of global imports. These economies are the frontrunners in ADP technologies.

**40 economies are following, but with lower values**

Other economies are also engaging in the new technologies, though with lower values. Israel, Italy and Sweden, for instance, show large shares of global patents, whereas Austria and Canada have high values of exports. By the same token, Mexico, Thailand and Turkey have high values of imports. These economies are followers in this technology race. Looking at the average values of patent, exports and imports indicators once the frontrunners are excluded, the report identifies 40 economies that would fall into this category. These economies explain 8 percent of global patents and almost half of all imports of goods embodying these technologies.

The rest of the world shows low or very low to no activity in this field

Taken together, only 50 economies (the frontrunners and followers) can be considered as actively engaging with ADP technologies. They are either producing or using these technologies to an extent captured by country statistics. The remaining economies show low (latecomers) or very low to no activity (laggards) in the field.
In most countries, different generations of digital technology applied to manufacturing coexist

Within countries, only a handful of firms are fully adopting ADP technologies

The 4IR affects a small portion of the economy in most countries

The global characterization just presented is confirmed when looking at the industrial sector of individual countries. In most countries, different generations of digital technology applied to manufacturing production coexist, and those associated with the 4IR have permeated only a small part of the sector.

Developing countries retrofit 4IR technologies to incomplete 3IR systems

Firms in developing countries still use—often ineffectively—3IR technologies. Their lack of command of 3IR technologies—basic automation and ICTs—also makes it difficult for them to fully engage with the opportunities of ADP technologies and the 4IR. The main opportunities for these countries lie, therefore, in the gradual integration of these technologies within existing 3IR production systems, retrofitting production plants in areas of the firm where integration is possible (Andreoni and Anzolin, 2019).

Different technological generations coexist

Building on the idea that at any given point in time firms in different countries are likely to use a combination of digital technologies emerging from different technological paradigms beyond the analog, IDR 2020 identifies four generations of digital manufacturing production based on their increasingly sophisticated use of digital technologies in production (Figure 5).²

As many as 70 percent of firms are still in analog production

The bottom of the pyramid represents an initial stage of production where digital technologies are not used in any area of the firm. This seems to be the reality in least developed countries (LDCs) and low-income economies. Most of the manufacturing sector in countries defined as laggards fall into this category. In Ghana, for instance, almost 70 percent of firms surveyed for this report fall in the analog category. Once firms start adopting digital technologies, four generations are distinguished. The first, rigid production, is characterized by the use of digital applications for specific purposes only and in isolation from each other. The second, lean production, refers to the semi-flexible automation of production with the aid of digital technology, accompanied by a partial integration across different business areas. The third, integrated production, entails using digital technologies across all business functions. The fourth and final mode is characterized by the use of digital technologies with information feedback to support decision-making.

Moving to the next generation requires big changes

Generation 1.0 and generation 2.0 have been around for as long as numerical control programming systems have existed (late 1950s), though devices such as CAD have evolved exponentially in recent years thanks to parametric engineering. Even if efficiency and quality of processes are substantially improved, evolving from generation 1.0 to generation 2.0 does not require major organizational changes. But evolving from generation 2.0 to generation 3.0 requires substantial changes—to fully integrate organizational functions, with comprehensive and effective standardization of processes and information systems. Generation 4.0 implies the use of ADP technology-based solutions, such as advanced communications devices, robotization, sensorization, big data and artificial intelligence.

Few firms use the most advanced technologies

Evidence collected for five countries show that only a handful of manufacturing firms are adopting ADP technologies (Figure 6). Despite large cross-country differences, in all countries surveyed, the diffusion of the highest generations of digital technologies (generations 3.0 and 4.0) is incipient: adopters represent a niche, ranging from 1.5 percent in Ghana to about 30 percent in Brazil. The survey results also show how different generations of technologies coexist within developing countries, creating “technological islands,” where a few firms with advanced technologies are surrounded by a majority of firms operating at a much lower technological level.

Leapfrogging into the 4IR depends on country and industry conditions

A key question for countries where most manufacturing firms lie far below the frontier—concentrated somewhere between analog and generation 1.0—is how can they move up in the technological ladder. In particular, can these firms skip some generations or directly leapfrog to the most advanced? Differences

### Figure 6

Adoption of ADP technologies is still limited among developing countries

- **Ghana**: 0.4%
- **Viet Nam**: 25%
- **Thailand**: 5%
- **Argentina**: 43%
- **Brazil**: 42%

*Note: Numbers in brackets are generation 0.0 firms. For Argentina and Brazil no information on generation 0.0 is available due to the structure of their survey questionnaires.*

*Source: UNIDO elaboration based on data collected by the UNIDO firm-level survey “Adoption of digital production technologies by industrial firms” (for Ghana, Thailand and Viet Nam) and Albres et al. (2019) and Kupfer et al. (2019) (for Argentina and Brazil).*
Some manufacturing industries are more likely to adopt ADP technologies

in capabilities, endowments, organizational characteristics and technological efforts, as well as domestic infrastructural and institutional conditions explain why some firms (and countries) succeed in ascending the ladder and others do not.

New technology diffusion is also concentrated by industry and size

The diffusion of ADP technologies is uneven across industries

Differences in technological intensity and production processes make some manufacturing industries within a country more likely to adopt ADP technologies. Two industries stand out: computer and machinery and transport equipment. These industries show above-average adoption of key ADP technologies (Figure 7).

The computer and machinery industry has the highest use of cloud computing and 3D printing technologies, 10–15 percentage points above average, while the transport equipment industry is ranked second and is top for the use of industrial robots in manufacturing. As ADP technologies continue their broad-based diffusion, other industries (even with low technology intensity) might also take the lead in the adoption of these technologies.

Frontrunners and followers tend to specialize in these industries

The stronger engagement of frontrunners and followers with ADP technologies also stem from the fact that they have a much higher share of technology- and digital-intensive (TDI) industries (comprising computer and machinery and transport equipment) in their MVA. These industries gained in importance especially after 2005, the year after which the diffusion of ADP technologies took off. Such superior performance is strongly driven by productivity growth. However, the story of their development is not about the substitution of the new technologies for labour—it is more about the contribution of these technologies to their competitiveness and expansion, which made the development process inclusive, thanks to the growth of both productivity and employment.

Larger firms adopt more ADP technologies

Size also matters when it comes to ADP technology. Large firms, thanks to—but not only to—the larger...
To engage with ADP technologies, developing economies must build industrial capabilities

Investments their resources permit, tend to enjoy technological and productive capabilities that make them more likely to adopt the new technologies. Data on the five countries surveyed for this report support this argument since a higher share of larger firms adopt the highest generations of digital production technologies (generations 3.0 and 4.0). In Argentina, for instance, the adoption rate within large firms (more than 100 employees) is 20 percentage points higher than the average rate of adoption. Nonetheless, in some cases (such as Thailand) the penetration of new technologies can also be strong in small firms.

What is needed to engage with ADP technologies?

Engaging requires industrial capabilities at the country level

Developing countries face five broad challenges

The vast majority of developing countries are far from becoming established players in this field because they face specific challenges in engaging with the new technologies. These challenges can be grouped under five broad headings (Andreoni and Anzolin, 2019):

- **Basic capabilities.** The production capabilities required for absorbing, deploying and diffusing ADP technologies along the supply chains are scarce and unevenly distributed. These technologies have also raised the “basic capability threshold,” not because they are entirely new but because they imply the fusion of new and existing technologies into complex integrated technology systems.

- **Retrofitting and integration.** Companies in developing countries that could make technology investments in this area have already committed resources to older technology, and they need to learn how to retrofit and integrate the new digital production technologies into their existing production plants. Setting up brand new plants is rarer because it requires significant long-term investment and access to markets.

- **Digital infrastructure.** These technologies demand substantial infrastructure for use in production. Some developing countries face significant challenges in providing affordable and high-quality electricity as well as reliable connectivity. These and other infrastructure bottlenecks might make technology investments by individual firms too risky and financially unviable.

- **Digital capability gap.** In many developing countries, companies engage with some ADP technologies, but many of these technologies remain contained within the company and, occasionally, a few close suppliers who have the basic production capabilities to use them. Around these 4IR islands, the vast majority of firms still use technologies typical of the 3IR or even 2IR. In this context, it is extremely difficult for the leading companies to link backwards and nurture their supply chains. When this digital capability gap is extreme, the diffusion of ADP technologies remains very limited.

- **Access and affordability.** These technologies tend to be controlled by a limited number of countries and their leading firms. Developing countries rely dramatically on importing these technologies and in many cases, even when they can mobilize the resources to access them, they remain dependent on providers for hardware and software components.

To engage with ADP technologies, developing economies must build industrial capabilities

Taken together, these challenges point in one direction—the need to build basic industrial production capabilities as a prerequisite to entering the 4IR. In fact, the differences in engagement with ADP technologies reflect the global heterogeneity of industrial capabilities: frontrunners tend to have larger industrial capabilities than followers, followers larger capabilities than latecomers and latecomers larger capabilities than laggards. In each group, a clear distinction can also be made based on production (innovating and exporting), which requires greater industrial capabilities than use.
The industrial capabilities of a country ultimately depend on the capabilities of firms

Industrial capabilities distinguish frontrunners and followers from latecomers and laggards

In 2017, the frontrunners presented an average Competitive Industrial Performance (CIP) index much higher than all other country groups (Figure 8). UNIDO’s CIP index reflects the industrial performance of countries and thus can be a proxy for their underlying industrial capabilities—higher CIP should be associated with stronger industrial capabilities. The followers in production had an average CIP half that of the frontrunners, but higher than that of followers in use. Followers also show larger CIP values than latecomers, who rank higher than laggards. Each category has an average CIP value larger than the previous one, illustrating the stairway of industrial capabilities that countries need to climb in order to engage and upgrade roles in the use and production of ADP technologies.

Industrial capabilities are built in manufacturing firms

Firm capabilities are preconditions for adopting new technologies

The industrial capabilities of a country ultimately depend on the capabilities of firms. So, the diffusion of ADP technologies depends on firms acquiring the necessary capabilities—executable routines or procedures for repeated performance in a specific context, produced by learning in an organization (Cohen et al. 1996). Many different capabilities are needed to engage with ADP technologies, but acquiring them is not an easy or linear process.

Investment, technology and production capabilities are crucial for adopting and using new technology

Investment and technology capabilities enable a firm to deal with technological change. They include the technological knowledge, resources and skills firms need to adopt and use equipment and technology, expand output and employment and further upgrade their technological competence and business activities. Production capabilities are related to experience, learning by doing and the behaviours of entrepreneurs related to production. These capabilities represent the first step for firms to acquire the base needed for further technology improvements.

Capabilities are accumulated gradually

Acquiring capabilities is often a gradual process, as firms and countries first industrialize and acquire basic capabilities, then upgrade towards higher levels of technology. Distinguishing developing country firm capabilities into basic, intermediate and advanced expresses the incremental steps for companies to accumulate capabilities over time (Table 2). Companies must go through this process to capture the opportunities offered by ADP technologies and to remain competitive and innovative.

Basic production capabilities remain critical

Mastering the basic capabilities—often associated with production—is critical for effectively deploying new technologies and retaining efficiency. Even the simplest productive activities often require the
In developing countries, a large number of low-capability actors coexists with more advanced ones. The activation and matching of interdependent clusters of capabilities. The development of these capabilities is related to the existence of an industrial ecosystem in which industrial firms can operate and learn.

**Each company has a “unique bundle of capabilities”**

As different companies face different learning challenges, their pace of developing new capabilities is likely to be uneven (Andreoni and Anzolin 2019). In developing countries in particular, this unevenness reinforces firm heterogeneity, with a large number of low-capability and low-performance actors coexisting with more advanced ones. This divide between the most advanced companies and the rest has been defined as the digital capability gap.

**The digital capability gap may harm both advanced and low-capability firms**

The gap’s direct consequence is the creation of the 4IR islands observed in Figure 6—a few major

The gap turns a technology upgrading opportunity into a digital industrialization bottleneck.

Leading companies engaged with ADP technologies operating as islands in a sea of firms without capabilities and still using outdated technologies. Leading firms may be harmed by the gap, because they have trouble linking backwards and nurturing their supply chains. Thus, the gap turns a technology upgrading opportunity into a digital industrialization bottleneck.

Engaging in industrial production is key to closing the gap. Policy debates tended to focus mostly on investment and technology capabilities. IDR 2020 shows that production capabilities are also of prime importance. An analysis of the determinants of adopting new technologies shows that production capabilities are the most important ones (Figure 9). These capabilities can be acquired only through past experience in industrial production.
Participation in GVCs positively affects the probability of adopting new technologies

Combined, the investment, technology and production capabilities lead to innovation

Investment and technology capabilities fully disclose their importance when combined with production capability variables. Production capabilities are more important to explain the adoption of technology. This does not mean that investment and technology variables do not matter. Combined, investment, technology and production capabilities delivered a premium of higher adoption rates of new processes technologies compared with firms where only one of the two categories of capabilities is present.

Firm participation in global value chains is associated with using ADP technology

For manufacturing firms in developing and emerging industrial economies, learning about ADP technologies may also depend on their integration in international trade and production networks. International trade and production networks can be viable channels for knowledge transfer to suppliers downstream in a global value chain (GVC). Evidence from the countries surveyed for this report confirms that participation in GVCs positively affects the probability of adopting new technologies. This positive correlation holds when controlling for other factors likely to shape the adoption of new production technologies, such as size, sector, human capital and R&D and machinery investments. Integration in manufacturing GVCs can represent an important opportunity for lagging countries to enter the ongoing technological race.

Engaging also requires specific skills in the labour force

ADP technologies require “skills of the future”

Technological change is not neutral when it comes to the skills demanded. The adoption of ADP technologies requires the development of skills complementary to the new technologies (Rodrik 2018). Three groups of skills (the “skills of the future”) are particularly important for ADP technologies: analytical skills; specific technology-related skills, including science, technology, engineering and math (STEM)—and ICT-related skills; and soft skills. As the jobs created by new technologies are likely to be more demanding of new and technical skills, and analytic and cognitive abilities, the skills of future will provide the best safeguard against the risk of displacement by technology.

Firms with higher technological intensity have more STEM professionals

Greater demand for these skills is already reflected in the employment profile of firms with higher technological intensity. The shares of STEM employees are consistently higher among more technologically dynamic firms, which are engaging or ready to engage with ADP technologies. Moreover, these firms also recognize the growing importance of technology-related skills, such as human–machine interaction.
ADP technologies can increase firm profits and capital use and improve environmental sustainability

skills. Soft skills are also projected to become very important in the future. The reason may be that many new technologies require employees to work as well-integrated teams and to learn procedures and systems rapidly.

What dividends can ADP technologies deliver?

ADP technologies can improve profits, sustain the environment and expand the labour force

ADP technologies can increase firm profits and capital use, better integrate the labour force in production and improve environmental sustainability. Figure 10 summarizes the main mechanisms at play, following the conceptual framework at the beginning of the overview. The potential benefits that ADP technologies can bring in supporting ISID are again presented along two major channels: the introduction of new and better goods into the market — smart TVs, smart watches, home control devices and so on — and the increase of production efficiency through the digitalization and interconnectivity of production processes. Each of these broad channels directly affects the main dimensions of ISID: industrial competitiveness, environmental sustainability and social inclusion. The benefits also entail risks, and there is no guarantee that these effects will occur without other changes. Reaping the benefits depends on conditions specific to the countries, industries and firms involved in manufacturing production.

Expanded data analytics improve products and services

ADP technologies can enhance product—service characteristics and functionalities that would result in higher revenue improvement — including product innovation, customization and time to market — and a more competitive product—service package. Data analytics, for instance, allow taking advantage of collecting and analysing real-time customer data, enabling the direct involvement of customer demands and facilitating cost-effective mass customization of products. These insights into customer behaviour can provide enormous advantages for new products, services

Figure 10

Expected dividends from ADP technologies

Economies actively engaging with ADP technologies show much faster growth than the rest

**Economies actively engaging with ADP technologies show much faster growth than the rest**

and solutions. The changes open new organizational and business model possibilities by attaching services to manufacturing production. In this way, ADP technologies open the possibility of revitalizing industrialization and boosting economic growth by creating new goods and by blending manufacturing and service activities.

**Fostering productivity**

*Firms adopting advanced technology have higher productivity*

Firms adopt ADP technologies to become more competitive and efficient. An econometric analysis conditional on other factors possibly affecting productivity of the countries surveyed for the report investigated whether firms with a higher level of digitalization were, on average, more productive than firms with lower levels (Figure 11). Even when controlling for a firm’s age, investments in research and development and machinery, human capital and GVC participation, the adoption of ADP technology was positively and significantly associated with firm productivity. Technology adoption’s coefficient is large compared with the coefficients of other important significant factors.

*Frontrunners and followers lead in manufacturing value added growth due to productivity growth*

What is true for the firms is also true for countries: economies actively engaging with ADP technologies—frontrunners and followers—show much faster growth of manufacturing value added (MVA) than the rest—latecomers and laggards (Figure 12). In low- and lower-middle income and high-income economies, frontrunners and followers have almost twice the growth rate of latecomers and laggards. In upper-middle income economies, the difference is more than 50 percent. Faster growth in MVA can be explained by more dynamic employment creation, faster productivity gains or both. The largest differences are observed in the productivity dynamics. Frontrunners and followers are clearly ahead in productivity growth.

Interestingly, in developing countries—low- and lower-middle income and upper middle income—frontrunners and followers also show positive growth in employment during this period. In high-income economies, instead, productivity growth more than compensated for a net destruction of direct jobs.

**Strengthening intersectoral linkages**

*New technologies foster knowledge-intensive business services*

The adoption of ADP technologies in manufacturing production requires additional support from other sectors of the economy, most notably knowledge-intensive services that provide the IT and digital solutions needed to implement smart production. This stronger interaction with services can potentially expand the multiplier effects of manufacturing production on job creation and
As countries deploy ADP technologies, knowledge-intensive business services play an increasing role

Poverty alleviation and open new windows of opportunity for countries to enter the manufacturing system.

Such services produce innovation and transmit new knowledge
Knowledge-intensive business services (KIBS) have an important role as producers of innovation and as carriers of new knowledge in an economy. They are mainly intermediate services (sold to other sectors rather than to final consumers), and through these linkages, they diffuse innovations along the value chain.

Frontrunners and followers tend to rely more on KIBS when producing industrial goods
The higher the income of the country group, the higher the share of KIBS in the value added generated by manufacturing, indicating the importance of knowledge-intensive inputs for the kinds of manufacturing activities undertaken by high-income economies. KIBS are not related just to country income levels. Across all income groups, the integration of KIBS is also larger in economies actively engaging with ADP technologies (Figure 13). As countries move to a higher level of engagement in developing and deploying ADP technologies, KIBS need to play an increasing role in manufacturing.

Creating jobs, not destroying them
Look beyond direct effects (workers displaced) to indirect and net effects
Concerns have been raised on the potential effect that ADP technologies can have in the labour market. But when evaluating the ultimate effect of a new technology (such as robots) on employment, all channels need to be considered. A sectoral or industry focus makes it difficult to assess the impact of technology on employment in the overall economy. So, it is necessary to analyse the direct and indirect macro effects of new technologies on employment. The indirect effects are based on both domestic and international linkages obtained from intercountry input-output tables. The indirect effects can outweigh the direct effects

To assess the impact of ADP technologies on employment, IDR 2020 finds that increasing the stock of...
Increasing the stock of robots in one industry has indirect effects on the rest of the value chain. The increase in the use of robots in one particular industry has a direct effect on the employment of that industry, but also indirect effects on the rest of the value chain (Figure 14). The increase in the use of robots in an industry has indirect effects on employment in customer and supplier industries. For example, the industry using more robots might produce intermediate products of better quality, sell at cheaper prices or both for its customer industries, which in turn could increase competitiveness and hire more workers to expand their businesses. That increase in the use of robots could also have an indirect impact on supplier industries because greater automation and changes in production processes could translate into greater demand for certain materials and components. Such a change in the demand emanating from a robotizing industry could have an impact on the employment of its supplier industries in either a positive or a negative way. At the same time, customers and suppliers can be located in the same economy (thus affecting domestic employment) or other economies (thus affecting foreign employment).

Between 2000 and 2014, the increase in industrial robots in manufacturing led to net job creation globally. Once all effects are considered, the contribution of annual growth in the stock of industrial robots to
Firms engaging with ADP technologies expect to increase—or at least keep—their employees

Employment growth from 2000 to 2014 is positive, though very small. The main positive effects come from international supplier linkages and domestic customer linkages. Domestic supplier linkages, in contrast, show negative effects on employment. Interestingly, most of the jobs were created in emerging economies due to the increase in the stock of robots in industrialized economies.

Firms using robots can generate more jobs than firms not using them

This indicates the importance of taking into consideration the possibility for output growth due to robot adoption in addition to its effect on change in the production process (increasing capital intensity), relative to nonadopting firms. If greater use of robots makes production management easier and increases capital’s income share relative to labor’s without much contributing to the firm’s or industry’s higher competitiveness and output increase, robot adoption is likely to have a negative impact on employment. But if robot adopters are to experience much faster growth than nonadopters—due to increased production scales, intersectoral complementarity, redistribution of work in a value chain and relocation of workers within a firm—firms and industries adopting robots are likely to have a higher chance of generating jobs than those avoiding robots.

Technologically dynamic firms anticipate stable (or even greater) employment

The findings are in line with recent studies using long-term firm level and worker-level data that show that (at least in frontrunner economies, such as Germany) the adoption of robots has not increased the risk of displacement for incumbent manufacturing workers (Dauth et al. 2018). This is also confirmed at the micro level in the five countries surveyed for this report: the majority of firms engaging or ready to engage with ADP technologies expect to increase (or at least keep) their employees with the adoption of those technologies.

New technologies can also improve workers’ conditions and involvement

ADP technologies also affect the social dimension of manufacturing production. They can improve workers’ conditions in industrial production by introducing new workflows and task allocations, as well as increasing the skill threshold of the workforce. For instance, automation solutions in the automotive sector have offered opportunities for reorganizing production tasks, moving workers away from those most physically demanding. ADP technologies can also improve working conditions in manufacturing plants. Today’s standard practice entails having workers manage advanced robots. The increased collaboration between humans and robots (or cobots) will create a blended workforce. Safety and tracking technologies also increase safety and improve working conditions on the shop floor.

Sustaining the environment

ADP technologies tend towards environmentally friendly solutions

ADP technologies have above-average green content (Figure 15). This is especially the case for the technologies related to robots, machine learning and CAD-CAM systems and, to less extent, for additive manufacturing technologies. The most important characteristic highlighted by patent reviewers of these technologies is their potential contribution to mitigating greenhouse gas emissions. This is another important dividend to consider, especially in relation to the ISID framework (see Figure 1).

ADP technologies boost circular economy processes

ADP technologies are also expected to boost circular economy processes, decoupling natural resource use from the environmental impact of economic growth. This, in turn, supports the achievement of the SDG 6 for energy, SDG 12 for sustainable consumption and production and SDG 13 for climate change. In circular economy processes, resource flows—particularly materials and energy—are narrowed and, to the extent possible, closed. Products are designed to be durable,
The use of ADP technologies would lead to environmental improvements

...reusable and recyclable, and materials for new products come from old products. Circular economy models also reduce the underuse of products and provide resource efficiency benefits. Data from electronic devices, networks and internet-connected equipment can provide companies with insights about how they use their resources and how they could improve the design of their products and services, product life-cycle management or supply chain planning (Rizos et al. 2018).

Technologically dynamic firms are optimistic about environmental improvements

Firm level data confirm this pattern. In Ghana, Thailand and Viet Nam, in all environmental domains—water, energy, materials and waste—the majority of firms already engaging or ready to engage with ADP technologies agree that the use of these technologies would lead to environmental improvements (Figure 16). Efficient use of materials means sustainability, but also savings that can trigger further expenditures and multiplier effects for firms and generate rebound effects increasing economic activity and thus environmental impact.

The dividends are not automatic and entail risks

Developing country firms face supply-chain reorganization and backshoring

An important area of concern regarding ADP technologies is their potential impact on the organization of global production. For firms in developing countries—especially those participating in GVCs—threats from supply chain reorganization, delocalization of production and backshoring are a common fear.

Digitalization could increase oligopoly and power concentration

Firms in developing countries may be harmed by the progressive integration of ADP technologies into GVCs,
ADP technologies might induce backshoring, even though it is not frequent

since they might face increasing barriers to access. As the increased digital integration of systems through software platforms affects the structure of GVCs, concerns arise about the coordination and governance mechanisms in fully digitalized supply chains and possibly increasing concentration of power and oligopolistic and monopolistic markets (Andreoni and Anzolin 2019).

Advanced country backshoring could make developing country cheap labour irrelevant
Firms in developing countries may also be harmed by the progressive diffusion of ADP technologies in advanced economies. The adoption of these technologies is expected to reduce the relevance of cheap labour as a comparative advantage and increased backshoring towards industrialized economies, taking away some manufacturing activities and reducing job creation (Rodrik 2018). New cheap capital machinery and robots replacing manual work could induce companies to return production to high-income countries close to big consumer markets. This phenomenon could counterbalance previous decades’ extension of GVCs to decentralize production from high-income countries to lower-income countries for activities requiring low skills and low salaries, such as assembly.

Not much backshoring is evident
Beyond hypotheses and anecdotal examples, however, general evidence of backshoring is still scarce, so drawing conclusions on the ultimate impact on developing country employment and designing sound policies to address it is difficult. Empirical work for this report using the 2015 European Manufacturing Survey data of firms from eight European countries (Austria, Croatia, Germany, the Netherlands, Serbia, Slovenia, Spain and Switzerland) analysed the extent and determinants of backshoring. Three clear findings emerge.

- First, backshoring is not as widespread as perceived in the media and in the policy debate: 5.9 percent of all firms have backshored, while 16.9 percent have offshored.
- Second, labour cost is not the main reason why firms backshore from emerging economies, but it is important in backshoring from other high-income countries. Flexibility in logistics appears to be the main reason for backshoring from emerging economies. This finding is surprising, since in the current debate, the fear of job displacement due to advanced technologies relates to introducing cheap machines or robots that can replace human labour by further reducing production costs.
- Third, backshoring is more frequent for some sectors (chemical industry, machinery, electrical industry or transport equipment—rather than low-technology sectors) and for firms more intensively adopting ADP technologies. So, ADP technologies might induce backshoring, even though it is not frequent.

Gender differences are pronounced in the susceptibility of jobs to digitalization
Yet another area of concern is gender inequalities. Extended adoption of ADP technologies might increase the gap between men and women in manufacturing labour markets, especially in developing countries. Female workers in manufacturing are found to be more exposed to the risk of computerization than men are, since the computerization risk they face is on average about 2.9 percent higher than that of their male colleagues (Figure 17). Considering the type of occupation currently performed, women are more likely to face a higher computerization risk than men if they are employed in food, beverages and tobacco, textiles and leather and chemicals. Interestingly no statistically significant gender differences in computerization risk are observed in the computers, electronics and vehicles sector.

Why do women tend to face a higher risk of losing jobs due to automation?
The gender differences in computerization risk can be explained by, among other reasons, differences in skill endowments. Women in manufacturing on average score significantly lower than male workers in all skills that are particularly valuable to operate with ADP technologies and that constitute the broad category
There are no one-size-fits-all solutions.

“skills of the future.” These skills are supposed to thrive in the 4IR and protect workers from destructive digitalization because they are less likely to be replaced by new technologies but, instead, more likely to be complemented by them. Gender gaps are significantly negative in all the “skills of the future.” As a more positive note for female workers, gender gaps in soft skills are less pronounced. Since recent empirical evidence supports the argument social skills are increasingly important, an advantage in these skills can contribute to narrowing gender gaps in the future.

Increasing women’s equitable participation promotes inclusive and sustainable industrial development

UNIDO recognizes the importance of a comprehensive debate on the relationship between gender and ADP technologies in manufacturing. Increasing women’s equitable participation in the industrial workforce and the development of technologies is necessary to promote inclusive and sustainable industrial development (UNIDO 2019b).

What policy responses can make ADP technologies work for ISID?

Responses are highly contextual

Strategic responses to ADP technologies are mixed across and within countries; they are highly contextual, reflecting the extent of industrialization, the penetration of digital infrastructure, the accumulation of technological and productive capabilities, the tradition of intervention in economic matters of national governments, and national priorities and capacities to mobilize public-private partnerships. There are no one-size-fits-all solutions, and it is still difficult to identify ready-made models. Generally, responses remain at the trial stage, with distinct degrees of articulation in long-term national development strategies.

And depend on the relative position of economies

Responses also depend on the relative position of economies: frontrunners, followers and latecomers have different goals and face different challenges. Frontrunners...
Adoption of ADP technologies requires important efforts in developing framework conditions. Their policy responses are oriented towards sustaining or regaining industrial leadership, and combine economic, social and environmental goals. For follower economies, the main aspiration is to close the technology gap with the frontrunners. This implies fostering innovation-driven development, building on the technological and industrial base that is already in place. Many of these economies host advanced manufacturing-ready firms and are even competing in economic activities traditionally reserved for highly industrialized countries. A key challenge is to disseminate throughout the rest of the economy the capabilities already in place in the most advanced part of the manufacturing sector (Rodrik 2018). For latecomers and laggards, what’s most important is to set up the basic conditions of infrastructure and capabilities to get ready to absorb the new technologies.

Some general areas for policy action need special attention

Although responses are highly contextual, three areas are very important

Enhancing readiness to adopt and exploit the new technologies requires action on three fronts: developing framework conditions, fostering demand and leveraging ongoing initiatives, and strengthening skills and research capabilities (Table 3).

Framework conditions include the institutionalization of multistakeholder approaches to industrial policy formulation

Adoption of ADP technologies requires important efforts in developing framework conditions related to regulations and digital infrastructure, the institutional setting for policy formulation and the channels for international collaboration and technology transfer. The institutional setting is particularly important to make ADP technologies work for ISID. New industrial policy formulation, in this context, should stem from close collaboration between private and public sectors, in which learning (identifying constraints), experimentation (finding ways of removing these constraints), coordination (placing all relevant stakeholders in the table) and monitoring (assessing the results) should be key guiding principles (Rodrik 2007, 2018).

Fostering demand requires awareness and funding

Even if the framework conditions are in place, countries need to foster the demand and adoption of the new technologies. This requires concentrated efforts

to raise the awareness of firms on the potential use and benefits of these technologies together with the facilitation of funding for their adoption. Targeted support should also be addressed to actors (for instance, small and medium-sized enterprises, SMEs) that are lagging from a technological perspective.

### Countries need to foster demand and adoption of new technologies

Table 3 (continued)

**Areas of policy action to make ADP technologies work for ISID**

<table>

| **Developing framework conditions** | Institutional infrastructure and private sector role    | Institutionalize multistakeholder and participatory approaches to industrial policy formulation, including public–private dialogue and shared leadership between different miniatures | • **Brazil**, the development of the Science and Technology and Innovation Plan for Advanced Manufacturing involved a triple-helix approach (government, private entities and education and research organizations). The Ministry of Science, Technology, Innovation and Communications and the Ministry of Industry, International Trade and Services lead from the government side. Significant knowledge came from a task force consulting private organizations about their perspectives on the challenges and opportunities stemming from smart manufacturing across different Brazilian industries and regions.  
• **Mexico**, the national strategy Roadmap 2030 built on a collaboration among the Ministry of Economy, ProSoft 3.0 (an official programme to promote the domestic software industry), the Mexican Association of Information Technologies and other private sector organizations.  
• **South Africa**, the Department of Telecommunications and Postal Services, the Department of Science and Technology and the Department of Trade and Industry led an integrated strategy, in consultation with industry, labour and civil society. In addition, a Presidential Commission on the 4IR was established in 2019 to coordinate work across all involved governmental institutions. |
| **International collaboration and technology transfer** | Facilitate connections with international initiatives around the adoption of ADP technologies | Establish partnerships with foreign organization and MNCs or consulting firms | • **China** and **Germany** agreed to promote readiness of their respective economies for ADP technologies in a memorandum of understanding linking Made in China 2025 and Industrie 4.0. The proposed activities consider the promotion of networks of Chinese and German enterprises in smart manufacturing. Collaboration is already bearing fruit through a Sino-German Industrial Park jointly established as a platform to connect Chinese enterprises and German technology.  
• In 2018, Nuevo León, **Mexico** signed a two-year memorandum of understanding with the Basque Country, **Spain**, to underpin collaboration between their respective ADP technology strategies. The government of Nuevo León recently launched the programme MIND4.0 Monterey 2019, a start-up accelerator that emulates a similar pilot initiative in the Basque Country (BIND 4.0) matching local manufacturing firms with domestic and foreign innovators and entrepreneurs.  
• **Kazakhstan**’s new digitalization strategy, Digital Kazakhstan, benefitted from collaboration of Germany’s Fraunhofer Institute with the Kazakhstan Ministry of Industry and Infrastructure Development. Activities included a diagnostic study of about 600 domestic companies’ readiness to adopt ADP technologies. Firm with semiautomated production will be supported to progressively transform into digital factories. Pilot companies started implementation in October 2018. |
| **Fostering demand and adoption** | Access and affordability of ADP technologies | Develop innovative funding mechanisms and support instruments or expand public funding for ecosystem enablers | • The government of **South Africa** proposed a Sovereign Innovation Fund to fund high-technology projects on smart manufacturing–related areas. The government pledged a seed investment of 1–1.5 billion rand (around $111 million) for 2019/2020. The fund is part of a strategy to support domestic firms to benefit from technology transfer.  
• In 2017, the government of Zhejiang Province, **China**, launched the Plan for Enterprises Deploying the Cloud, an initiative to promote adoption of and innovation in cloud technologies, particularly among small and medium-sized enterprises. The initiative combines funding through voucher schemes to lower the cost of cloud technology with a complex approach to foster capabilities. As part of the programme more than 1,100 seminars on cloud computing have been organized, covering more than 90,000 industrial firms and 100,000 participants. |
Governments can support the strengthening of capabilities through dedicated learning centres

### Fostering demand and adoption

<table>
<thead>
<tr>
<th>Broad area</th>
<th>Issue to be tackled</th>
<th>Specific actions</th>
<th>Country examples</th>
</tr>
</thead>
</table>
| Fostering demand and adoption | Awareness regarding use and benefits of ADP technologies | Develop awareness centres and organize international summits, conferences and workshops to expand firms’ knowledge of ADP technologies | • In 2017, the government of India opened four new centres for promoting ADP technologies in Bangalore, New Delhi and Pune. While independent, the centres fall under the purview of the Ministry of Industry, Department of Heavy Industry. Their mandate is to support the implementation of Make-in-India, particularly by enhancing manufacturing competitiveness through a better understanding and broader adoption of ADP technologies by manufacturing small and medium-sized enterprises.  
• Since 2015, the government of Viet Nam has organized annual summits or international gatherings to raise awareness, explore and possibly tighten public–private collaboration or demonstrate technologies and solutions available for domestic agents interested in ADP technologies. |

### Strengthening capabilities

<table>
<thead>
<tr>
<th>Broad area</th>
<th>Issue to be tackled</th>
<th>Specific actions</th>
<th>Country examples</th>
</tr>
</thead>
</table>
| Strengthening capabilities | Development of human resources | Enhance international collaboration around skill development and employability | • In Spain, the government of the Basque country launched Basque Industry 4.0, which includes pilot activities to assist domestic SMEs in accessing training on ADP technologies associated with manufacturing, and spaces designed for self-diagnosis and fine-tuning for advanced manufacturing.  
• In 2019, the government of Malaysia launched Industry4WRD Readiness Assessment, a programme under the national strategy Industry4WRD that helps to determine small and medium-sized enterprises’ readiness to adopt ADP technologies. |

| | Development of research capacities | Expand the scope and number of research institutions | The government of Uruguay, in collaboration with UNIDO and the German industrial control and automation company Festo, has established the Centre of Industrial Automation and Mechatronics (CAIME), a public technology centre to upgrade technical skills and encourage domestic firms to adopt smart manufacturing processes.  
• In Malaysia, the Ministry of Human Resources offers a National Dual Training Scheme, inspired by the German Dual Vocational Training Programme, aimed at equipping workers to use ADP technologies.  
• In Chile, the Office of Economy of the Future launched the project Astrodatta, whose objective is to capitalize on the processing potential of astronomical big data and cloud computing, not only for scientific applications and human capital development but also for economic purposes.  
• In Kazakhstan, the Ministry of Education and Science will mobilize research capacities at the Industrial Automation Institute (based in the Kazakh National Research Technical University) to carry out applied research and technology transfer connected with technological problems faced by business seeking to use ADP technologies. |

### Capabilities build on new skills and research

Ultimately, for firms to be able to adopt the new technologies, the required capabilities in terms of skills and research should be in place. Governments can support the creation and strengthening of these capabilities through dedicated learning centres and new approaches to technical and vocational education and trainings that are aligned with the emerging requirements of firms. Expanding the scope and number of research institutions which are specifically dealing with ADP technologies is also key for the absorption of these technologies and their adaptation to the local environment.
Without international support, low-income countries run the risk of being stymied even more

A call for further international collaboration

New windows of opportunity will depend on individual responses and readiness
How much will ongoing breakthroughs in ADP technologies open new windows of opportunity to leapfrog, or to avoid falling farther behind? The extent will depend on individual responses and readiness through active industrial policy, digital literacy, skills and education—and not just wage rates, domestic markets and positions in global value chains (Lee et al. 2019, Mayer 2018).

Remember that it takes commitments and substantial resources to develop capabilities
Policy-makers, particularly in developing countries, should remember that it takes commitments and substantial resources to develop the capabilities required to take up new technologies and assimilate any associated productive transformations (Lee 2019, Steinmueller 2001). Taking small but well-informed steps to test technological and policy options, according to the desired goals, is recommended before committing fully to implementation. There is much room for further research and policy experimentation to learn and exchange policy lessons through enhanced international collaboration.

The international community should support lagging economies
The results in the report indicate that large parts of the world, mostly LDCs and other low-income countries, are still far from engaging with the new technologies. This calls for immediate action from the international community to support developing countries—especially LDCs—in adopting the ongoing technological breakthroughs. Without international support, low-income countries run the risk of being stymied even more, lagging farther behind and failing to achieve several (if not all) the SDGs. As discussed above, this support should be oriented towards building basic, intermediate and advanced industrial and technological capabilities, together with digital infrastructure.

There is good scope for further international collaboration
Important benefits can come from close collaboration among countries at different stages of readiness for the adoption of ADP technologies. The potential for expanding such collaboration is significant. In many national strategies of follower economies, some frontrunner economies are identified as a preferred partner to facilitate technology transfer, human resource development and joint implementation of pilot projects, but also to explore joint business models. Partnerships can also be done with other countries at similar levels of adoption of ADP technologies. Knowledge transfers can take place on a more equal footing and be closer to common realities. For the BRICS, such collaboration is already motivating joint research activities and innovation agendas on big data, ICTs and other ADP technologies and their applications, as well as on ICT infrastructure and connectivity (BRICS Information Centre 2017).

Closer collaboration should be the basis of national strategies
Closer collaboration should be the basis of strategies to address developing countries’ diverging views on the challenges that ADP technologies might bring in their path towards inclusive and sustainable industrial development. Many of these questions are not new, but the issues are becoming more pressing because of their possible implications for digital divides. Consensus on the challenges and opportunities is still largely out of reach, and domestic politics are likely to stall major international collaborations. That is why international policy coordination and collaboration should continue to buttress efforts to leap forward, enabling organizations and countries to share knowledge and experiences on how to identify and address the opportunities and challenges stemming from the 4IR—and ensure that no one is left behind.
Notes
1 In this report, global patents are defined as those patents that are simultaneously applied in at least two of the following patent offices: the European Patent Office, the United States Patent and Trademark Office, the Japan Patent Office and the China National Intellectual Property Administration Office.
2 These generations were first proposed by IEL (2018) and then elaborated further in the UNIDO background paper by Kupfer et al. (2019).
3 For full results see the UNIDO background paper prepared by Pietrobelli et al. (2019).
4 The analysis is based on the UNIDO background paper prepared by Ghodsi et al. (2019) and builds on the existing empirical work on the relationship between technological change, employment and industrial growth pioneered by Abeliansky and Prettner (2017), Acemoglu and Restrepo (2018) and Graetz and Michaels (2018).
5 See UNIDO background paper prepared by Dachs and Seric (2019) for the details of the analysis.

Source: UNIDO elaboration based on dataset by Foster-McGregor et al. (2019).
“New technologies are a double-edged sword for developing nations. They can enable leapfrogging and faster economic catchup. But in the absence of basic capabilities, skills, and institutions, they also raise barriers to convergence by laggards. This data-filled report presents an up-to-date picture of the technology landscape and outlines strategies for making the most out of the opportunities while avoiding the pitfalls.”

Dani Rodrik, Harvard University

“UNIDO reminds the world in this report that industrialization continues to be essential for economic development. It argues that, through increased productivity and the development of new production sectors, the digital technologies offer significant opportunities in terms of improvements in standards of living and environmental sustainability. They also pose great challenges, given the limited diffusion of these technologies in most developing countries. It calls, therefore, for significant efforts to develop the digital infrastructure, build up the essential human skills and strengthen the research capacities of developing countries—all of which are also areas for increased international cooperation.”

José Antonio Ocampo, Central Bank of Colombia and Columbia University
